

Introduction to Scilab

Deepak U. Patil

July 26, 2011

Outline

1 Matrix Manipulations

2 Control Systems

Defining a matrix

- In Scilab, Everything you define is stored as a matrix.
- $A=[1\ 0\ 0;1\ 2\ 0;1\ 1\ 3]$
- $\det(A)$
- $\text{spec}(A)$
- $a=[1\ 2\ 3]$ and $b=[2\ 3\ 4]$.
- $a*b$
- $a.*b$
- $a'*b$
- $a*b'$
- $\text{size}(a)$
- $\text{length}(a)$
- $\text{diag}(a)$

Submatrix extraction

- $k=1:5$ gives $k=[1\ 2\ 3\ 4\ 5]$
- $k=1:2:9$ gives $k=[1\ 3\ 5\ 7\ 9]$
- $A=[1\ 2\ 3\ 4;1\ 3\ 5\ 7;2\ 4\ 6\ 8]$
- $A(:,1)$ is first column
- $A(2,:)$ is second row
- $A(2,4)$ is the entry at second row, fourth column.

Submatrix extraction contd.

- $A([1,3],[2,4])$
- $A(1:3,2:4)$
- \$ stands for last index
- $A(1:\$,2:\$)$ will yield same result as $A(1:3,2:4)$

System of linear equations

Example

$$2x+y=6 \text{ and } x+y=2$$

- $x=A \setminus b$
- $[x, \text{ker}] = \text{linsolve}(A, b)$
- $x = \text{lsq}(A, b)$

Example

$$2x+y=6$$

- $x=A \setminus b$
- $[x, \text{ker}] = \text{linsolve}(A, b)$
- $x = \text{lsq}(A, b)$

System of linear equations

Example

$2x+y=6, x+y=2$ and $x-y=2$

- $x=A \setminus b$
- $[x, \text{ker}] = \text{linsolve}(A, b)$
- $x = \text{lsq}(A, b)$

Example

$2x+y=6, x+y=2$ and $3x+y=10$

- $x=A \setminus b$
- $[x, \text{ker}] = \text{linsolve}(A, b)$
- $x = \text{lsq}(A, b)$

Defining a linear system

- `s=%s`
- `typeof(s)`
- `N=s+1`
- `D=s^2+5*s+6`
- `H=syslin('c',N,D)`
- `typeof(H)`
- `H=syslin('c',A,B,C,D)`

Simulating a system

- `t=0:0.1:5;`
- `y=csim('step',t,H)`
- `plot(t,y)`
- `u=sin(t)`
- `y=csim(u,t,H)`
- `plot(t,[u;y])`

Rootlocus/Bode plot/Nyquist plot

- `evans(H)`
- `bode(H)`
- `nyquist(H)`.
