

## Interim Project Progress

### DIGITAL PROTOTYPE FOR PREOPERATIVE RISK ASSESSMENT OF ANAESTHESIA USING MACHINE LEARNING

For your project, briefly describe what is the problem you are looking at. What are the predictor variables and the response variable(s)?

#### Problem Statement-

Before conducting surgery and other major operative procedures, the anaesthesiologists rely on verbal data evaluation to assess whether the patient is fit for surgery or not at the moment. This is a time-consuming procedure. As discussed with one of the anaesthesiologists in AIIMS Delhi, they wish to develop an application which could take in current health parameters and determine the risk level of conducting the surgical procedure with anaesthesia.

Thus, we are developing a model that could predict patients' risk levels based on their previous background or medical history using Machine Learning. Using this model, users or patients can provide their medical history or give inputs like sugar, blood pressure, heart pulse, etc.

This model leads to results that will tell the users or patients whether they should go for anaesthesia. Whether before going for anaesthesia, there must be some treatments to be done. Directly, it would be beneficial for the Doctors to review the patient's status before surgery. Even a user or patient could also understand his or her situation and take decision accordingly.

❖ The predictor variables are:

1. Blood Pressure (Systolic/Diastolic) mm of Hg.
2. Blood Sugar Level (Fasting) mg/dL
3. Creatinine Level mg/dL

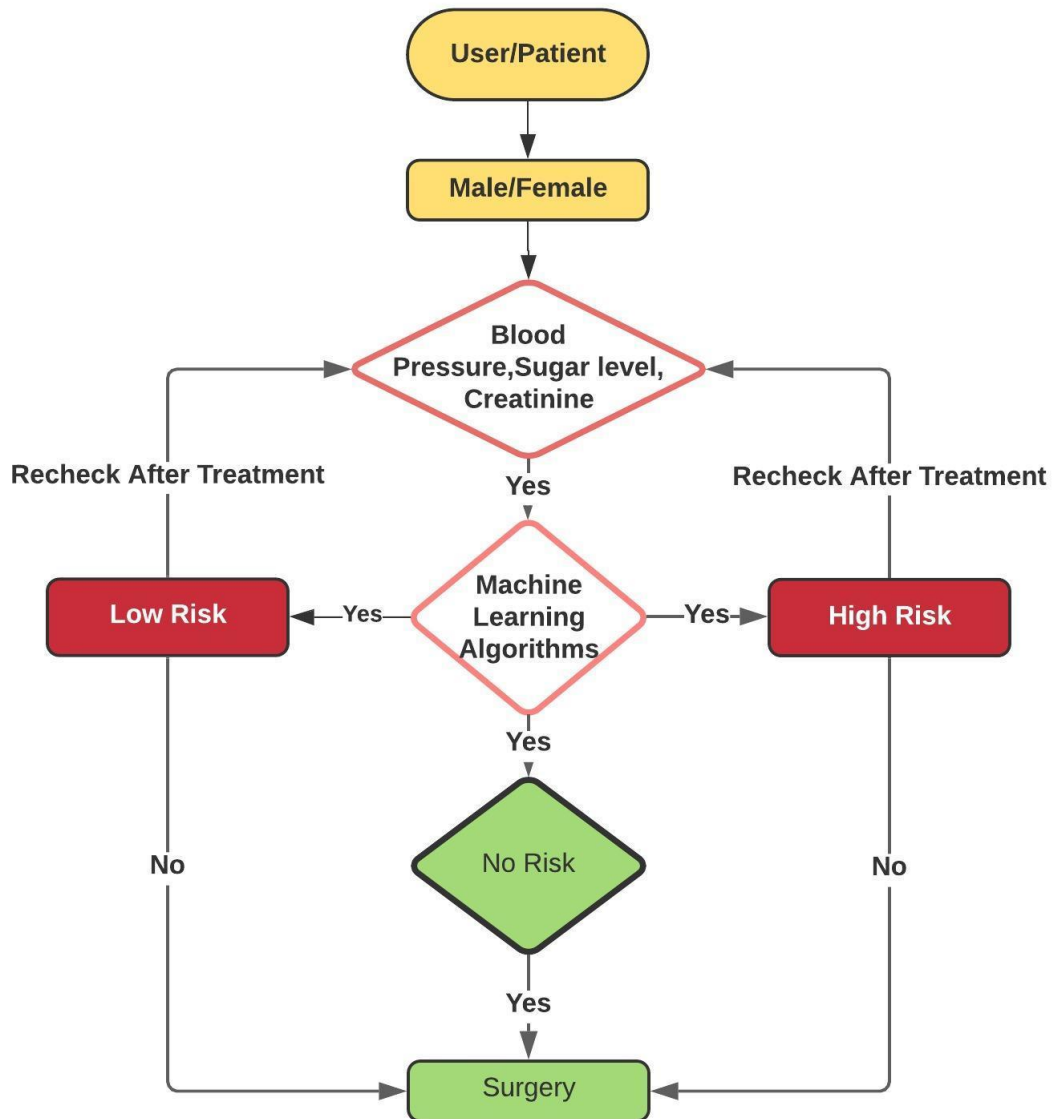

❖ The response variable is Risk level (High/Low)

#### What are the sources of data?

The data has been obtained from Dr. Nishkarsh Gupta Associate Professor of Onco-anaesthesia & Palliative Medicine, Dr.B.R.A.IRCH, AIIMS, Delhi, India. This data has been collected through PAC forms shared by Dr. Gupta which contains patient's health details such as blood pressure, sugar level, haemoglobin, etc. A sample form is as shown below:

Please share the rough schema of your project data.

Please perform the first cut analysis using data collection, data pre-processing and data visualization and share insights for your project.

- Importing datasets from .csv format in the form of a table..

```
table= readtable("Anaesthesia.csv", "PreserveVariableNames", true);
table
```

table = 8x14 table

This program was written in the month of November when we had limited datasets. We have now collected a total of 100 datasets. The data preprocessing & visualization part is complete and we have headed towards building a digital prototype.

For our project purpose, we have been suggested to use only these three predictor variables due to limited reliable data availability. However, it is anticipated that the current program can be made comprehensive at a later stage to include more variables for prediction depending upon the availability of data with Dr. Nishkarsh Gupta.
