

Master of Technology in Computer Technology

Department of Electrical Engineering

Overall credit structure

Category	PC	PE	OC	Total
Credits	21	24/27 ¹	3/6 ²	51

Sem	Courses					Lecture Courses	Contact hrs/week				Credits
							L	T	P	Total	
I	[PC-1] ELL780 Mathematical Foundations of Computer Technology (3-0-0)	[PC-2] ELL781 Software Fundamentals for Computer Technology (3-0-0)	[PC-3] ELL782 Computer Architecture (3-0-0)	[PE-1] ZZyxxx (3-0-0)	[PE-2] ZZyxxx (3-0-0)	5	15	0	0	15	15
II	[PC-4] ELL783 Operating Systems (3-0-2)	[PC-5] ELD780 Minor Project (0-0-4)	[PE-3] ZZyxxx (3-0-0)	[PE-4] ZZyxxx (3-0-0)		4	9	0	6	15	12
Summer: [PC-6] ELD880 Major Project Part 1 (for M.Tech with Dissertation)											
III (M.Tech with Dissertation)	[PC-6] ELD880 Major Project Part 1 (0-0-12)	[PE-5] ZZyxxx (3-0-0)	[OE-1] ZZyxxx (3-0-0)			2	6	0	12	18	12
III (M.Tech without Dissertation)	[PE-5] ZZyxxx (3-0-0)	[PE-6] ZZyxxx (3-0-0)	[PE-7]/[OE-1] ZZyxxx (3-0-0)	[PE-8]/[OE-2] ZZyxxx (3-0-0)		4	12	0	0	12	12

¹ Related to point 2, below:

² Those not opting for the Dissertation can do a maximum of 6 OC credits; those opting for the Dissertation can do a maximum of 3 OC credits.

IV (M.Tech with Disserta tion)	[PE-6] ELD881 Major Project Part 2 (0-0-24)					0	0	0	24	24	12
IV (M.Tech without Disserta tion)	[PC-6] ELD880 Major Project Part 1 (0-0-12)	[PE-7]/[OE-1] ZZyxxx (3-0-0)	[PE-8]/[OE-2] ZZyxxx (3-0-0)			2	6	0	12	18	12

Notes:

- The example above considers only lecture courses (ZZLxxx). The total number of credits for Semesters II, III, and IV can be composed of other 3-credit laboratory courses (ZZPxxx) as well, as mentioned in the baskets below. If the course is that of the Department of Electrical Engineering, ZZ would be EL, for instance.
- There are three types of courses: Programme Core (PC), Programme Elective (PE), Open Elective (OE). Any course in the list of Programme Cores is a PC, any course in the list of Programme Electives is a PE, and all other courses can be considered OEs.
- The Programme Electives (PEs) have been structured as follows. A student has to choose from one of the **five** possible streams in the programme: Cognitive and Intelligent Systems (CIS), Embedded Intelligent Systems (EIS), Computer Communication and Networks (CCN), Multimedia Information Processing (MIP), and Internet Technologies (IT). The PEs that must be taken corresponding to a particular stream are listed in the table below. To emphasise this fact, these courses are written in **italicised bold-face** as the first two courses of each stream, in the list of PEs associated with the particular streams. The remaining PEs should preferably be taken from within the PE list specified for the student's chosen stream.

Stream	Course Numbers and Titles	
CIS	ELL784: Introduction to Machine Learning	ELL786: Multimedia Systems
EIS	ELL784: Introduction to Machine Learning	ELL787: Embedded Systems and Applications
CCN	ELL785: Computer Communication Networks	ELL786: Multimedia Systems
MIP	ELL786: Multimedia Systems	ELL787: Embedded Systems and Applications
IT	ELL784: Introduction to Machine Learning	ELL785: Computer Communication Networks

- A Programme Elective (PE) can be taken in place of an Open Elective (OE)

- Students registering for Program Elective ELD881 Major Project Part 2, will have printed on their transcript, 'M.Tech with Dissertation'.
- Courses mentioned in red colour: from other groups/Departments

Programme Core (PC)

Course#	Title	L-T-P	Credits

COURSE TEMPLATE

1.	Department/Centre proposing the course	Electrical Engineering
2.	Course Title (<45 characters)	Computer Architecture
3.	L-T-P Structure	3-0-0
4.	Credits	3
5.	Course Number	ELL782
6.	Status (category for program)	Program Core

7.	Pre-requisites (course no/title)	None
----	---	------

8	Status vis-a-vis other courses (give course number/title)	
8.1	Overlap with any UG/PG course of the Dept./Centre	ELL308 Computer Architecture (UG)
8.2	Overlap with any UG/PG course of other Dept./Centre	COL7xxx Architecture of Large Systems, COL4xx Computer Architecture (UG)
8.3	Supersedes any existing course	EEL601 Computer Architecture

9.	Not allowed for (indicate program names)	
----	---	--

10.	Frequency of offering	☐ Every sem ☒ 1st sem ☐ 2nd sem ☐ Either sem
-----	------------------------------	---

11.	Faculty who will teach the course Santanu Chaudhury, Sumantra Dutta Roy, Turbo Majumder, S.M.K. Rahman, Sumeet Agarwal
-----	--

12.	Will the course require any visiting faculty? (yes/no)	No
-----	---	----

13.	Course objectives (<i>about 50 words</i>): The course intends to familiarise a student with developments in the architecture and application areas with computer systems, and their components: processors, cache, main memory, and disk systems. The course will examine parallelising operations in hardware to achieve higher performance throughputs, and at a software level as well: parallel algorithms on some sample architectures.
------------	--

14.	Course contents (<i>about 100 words</i>) (<i>Include laboratory/design activities</i>): Instruction set design, pipelining, memory hierarchy design, parallelism in various forms, warehouse scale computers, specific topics such as Vector, SIMD, GPU architectures, Embedded Systems, VLIW, EPIC, Multi-core architectures
------------	---

15. Lecture Outline (*with topics and number of lectures*)

Module no.	Topic	No. of hours
1	Quantitative design and analysis; Instruction set samples	1
2	Instruction-level parallelism; Pipelining	6
3	Memory Hierarchy Design; Cache; Virtual Memory	6
4	Thread Level Parallelism	6
5	Data-Level Parallelism in Vector, SIMD, GPU Architectures	4
6	Warehouse Scale Computers; Blade Architecture; Interconnected Networks	8
7	Miscellaneous Topics: Hardware and Software for VLIW and EPIC; Multi-core Architectures; Storage Systems	11
COURSE TOTAL (14 times 'L')		42

16. Brief description of tutorial activities:

Module no.	Description	No. of hours

17. Brief description of laboratory activities

Module no.	Description	No. of hours

18. Brief description of module-wise activities pertaining to self-study component (mandatory for 700/800 level courses)

Module no.	Description	No. of hours
1	Review of Computer Organisation fundamentals; Pipelining, Memory hierarchy	20
2	Development and Implementation of Parallel Algorithms on sample architectures	22

19. Suggested texts and reference materials

STYLE: Author name and initials, Title, Edition, Publisher, Year

J. L. Hennessey, D. A. Patterson. Computer Architecture: A Quantitative Approach, Fifth Edition, Morgan Kaufmann, 2011.
A. Grama, A. Gupta, G. Karypis, V. Kumar. Introduction to PArallel Computing, Second Edition. Addison-Wesley, 2003.

20. Resources required for the course (*itemised & student access requirements, if any*)

20.1	Software	MPI, threads libraries
20.2	Hardware	
20.3	Teaching aids (videos, etc.)	
20.4	Laboratory	
20.5	Equipment	
20.6	Classroom Infrastructure	
20.7	Site visits	
20.8	Others (please specify)	

21. Design content of the course (Percent of student time with examples, if possible)

21.1	Design-type problems	Parallel Computing Mini Project
21.2	Open-ended problems	Parallel Computing Mini Project
21.3	Project-type activity	Parallel Computing Mini Project
21.4	Open-ended laboratory work	Parallel Computing Mini Project
21.5	Others (please specify)	

Date:

(Signature of the Head of the Department)

COURSE TEMPLATE

1.	Department/Centre proposing the course	Electrical Engineering
2.	Course Title (<45 characters)	Software Fundamentals for Computer Technology
3.	L-T-P Structure	3-0-0
4.	Credits	3
5.	Course Number	ELL781
6.	Status (category for program)	PC for EET

7.	Pre-requisites (course no/title)	COL106
----	----------------------------------	--------

8	Status vis-a-vis other courses (give course number/title)	
8.1	Overlap with any UG/PG course of the Dept./Centre	
8.2	Overlap with any UG/PG course of other Dept./Centre	
8.3	Supersedes any existing course	

9.	Not allowed for (indicate program names)	
----	--	--

10.	Frequency of offering	☐ Every sem ☒ 1st sem ☐ 2nd sem ☐ Either sem
-----	-----------------------	---

11.	Faculty who will teach the course	
-----	-----------------------------------	--

	Sumantra Dutta Roy, Sumeet Agarwal, Santanu Chaudhury
--	---

12.	Will the course require any visiting faculty? (yes/no)	no
-----	--	----

13.	Course objectives (about 50 words): On completion of the course, we expect a student to be able to do the following: (i) Choose the data structures that effectively model the information in a problem (ii) Judge efficiency trade-offs among alternative algorithms and data structures for implementations (iii) Apply algorithm analysis techniques to evaluate the performance of an algorithm and to compare data structures (iv) Apply object-oriented design principles (v) Apply design guidelines to evaluate alternative software designs (vi) Design dependable system
-----	---

14.	Course contents (about 100 words) (Include laboratory/design activities): Introduction, data structures for combinatorial optimization: heaps, union-find, Fibonacci heaps, dynamic trees, dynamic graph structure; Asymptotic analysis; Divide & conquer and graph algorithms: Graph search: Breadth first, depth first, topological sorting, Fast Fourier Transform, Matrix Multiplication, Shortest path algorithms; Additional Data Structures: Suffix trees & string matching, Splay trees & amortized analysis; Advanced algorithmic design techniques: Dynamic programming (edit distance, chains of matrix multiplication, etc.), Network flow and its use for solving problems; Linear and integer programming, NP-completeness, Randomized algorithms (hashing & global minimum cut), Approximation Algorithms; Object oriented Software design, Design of Dependable Software.
-----	--

15. Lecture Outline (with topics and number of lectures)

Module no.	Topic	No. of hours
1	Introduction	1
2	Data structures for combinatorial optimization: heaps, union-find, Fibonacci heaps, dynamic trees, dynamic graph structure	4
3	Asymptotic analysis	2
4	Divide & conquer and graph algorithms: Graph search: Breadth first, depth first, topological sorting, Fast Fourier Transform, Matrix Multiplication, Shortest path algorithms	5
5	Additional Data Structures: Suffix trees & string matching, Splay	5

	trees & amortized analysis	
6	Advanced algorithmic design techniques: Dynamic programming (edit distance, chains of matrix multiplication, etc.)	5
7	Network flow; Linear and integer programming	5
8	NP-completeness	2
9	Randomized algorithms (hashing & global minimum cut)	3
10	Approximation Algorithms	3
11	Object oriented Software design	5
12	Design of Dependable Software	2
COURSE TOTAL (14 times 'L')		42

16. Brief description of tutorial activities:

Module no.	Description	No. of hours

17. Brief description of laboratory activities

Module no.	Description	No. of hours

--	--	--

18. Brief description of module-wise activities pertaining to self-study component (mandatory for 700/800 level courses)

Module no.	Description	No. of hours
1	C, C++/Java and Python Programming	20
2	UML	5
3	Requirement Analysis and Modeling	5
4	Fault-tolerant and persistent data structures	5
5	Online and Data Stream Algorithms	5

19. Suggested texts and reference materials

STYLE: Author name and initials, Title, Edition, Publisher, Year

1. Thomas H. Cormen, Charles E. Leiserson, Ronald L Rivest, Clifford Stein, Introduction to Algorithms 3e by MIT Press, 2009.
2. Bernd Bruegge, Allen H. Dutoit, Object-Oriented Software Engineering Using UML, Patterns and Java, Second Edition. Prentice Hall, 2004.

20. Resources required for the course (*itemised & student access requirements, if any*)

20.1	Software	Standard Compilers and Programming Environment
20.2	Hardware	
20.3	Teaching aids (videos, etc.)	
20.4	Laboratory	
20.5	Equipment	

20.6	Classroom Infrastructure	Multimedia Projector
20.7	Site visits	
20.8	Others (please specify)	

21. Design content of the course (Percent of student time with examples, if possible)

21.1	Design-type problems	15%
21.2	Open-ended problems	
21.3	Project-type activity	15%
21.4	Open-ended laboratory work	
21.5	Others (please specify)	

Date:

(Signature of the Head of the Department)

COURSE TEMPLATE

1.	Department/Centre proposing the course	Electrical Engineering
2.	Course Title (<45 characters)	Mathematical Foundations of Computer Technology
3.	L-T-P Structure	3-0-0
4.	Credits	3
5.	Course Number	ELL780
6.	Status (category for program)	PE for EET

7.	Pre-requisites (course no/title)	Nil
----	----------------------------------	-----

8	Status vis-a-vis other courses (give course number/title)	
8.1	Overlap with any UG/PG course of the Dept./Centre	No
8.2	Overlap with any UG/PG course of other Dept./Centre	Slight overlap with ELL701 Mathematical Methods in Control
8.3	Supersedes any existing course	No

9.	Not allowed for (indicate program names)	
----	--	--

10.	Frequency of offering	☐ Every sem ☒ 1st sem ☐ 2nd sem ☐ Either sem
-----	-----------------------	---

11.	Faculty who will teach the course	Prof. Jayadeva, Prof. Santanu Chaudhury, Dr. Sumeet Agarwal
-----	-----------------------------------	---

12.	Will the course require any visiting faculty? (yes/no)	May use
-----	--	---------

13.	Course objectives (<i>about 50 words</i>): A significant fraction of Masters level students possess weak or inadequate skills in several areas of mathematics. This course is intended to provide Masters students with a concise treatment of multiple topics needed in many of the streams being offered, without being mathematically detailed.
-----	---

14.	Course contents (<i>about 100 words</i>) (<i>Include laboratory/design activities</i>): Probability theory, stochastic processes, and statistical inference. Elements of real and complex analysis, and linear algebra. Optimization, with an emphasis on application and implementation.
-----	---

15. Lecture Outline (*with topics and number of lectures*)

Module no.	Topic	No. of hours
1	Elements of probability and stochastic systems with reference to computer engineering problems (e.g., machine learning, computer networks, performance evaluation)	7
2	Basics of real and complex analysis; notion of generalised functions and distributions, distance between distributions	6
3	Linear Algebra, matrix operations in image and signal processing, basics of manifolds	7
4	Optimization: basics and types of optimization problems	3
5	Linear and Quadratic Programming, with applications in computer engineering	6
6	Nonlinear Optimisation, Global Optimisation	3
7	Hill climbing and Stochastic Optimisation	3
8	Monte Carlo simulations, Gibbs Sampling	3
9	Elements of Game Theory	4
COURSE TOTAL (14 times 'L')		42

16. Brief description of tutorial activities:

Module no.	Description	No. of hours

17. Brief description of laboratory activities

Module no.	Description	No. of hours
	None	

18. Brief description of module-wise activities pertaining to self-study component (mandatory for 700/800 level courses)

Module no.	Description	No. of hours
1	Probability and Statistics: theoretical foundations, inference techniques, approximate inference	10
2	Distributions	5
3	Differential and Partial Differential Equations	5
4	Linear Algebra: foundations, computational techniques (e.g., matrix inversion)	7
5	Optimisation: applications of different algorithms and comparative analyses	15

-----	--	--

12.	Will the course require any visiting faculty? (yes/no)	No
-----	---	----

13.	Course objectives (about 50 words): The course introduces a student to various part of typical Operating Systems, and ways and means to interact with Operating Systems.	
-----	--	--

14.	Course contents (about 100 words) (Include laboratory/design activities): Processes and threads; CPU scheduling; concurrency, synchronisation; deadlocks; Memory management; files and I/O; Real-time operating systems; basics of Cloud computing	
-----	--	--

15. Lecture Outline (with topics and number of lectures)

Module no.	Topic	No. of hours
1	Introduction; Relation with Computer Architecture	1
2	Processes, Inter-process Communication	2
3	Threads	2
4	Concurrency Issues	6
5	Deadlocks	2
6	Memory Management	2
7	Files and I/O	2
8	Real-Time Systems	3

9	Multi-core/Multi-Processor Operating Systems	4
10	Energy Management in Operating Systems	4
11	Distributed Operating Systems	5
12	Case Studies: Linux, Android	6
13	Basics of Cloud Computing	3
COURSE TOTAL (14 times `L')		42

16. Brief description of tutorial activities:

Module no.	Description	No. of hours

17. Brief description of laboratory activities

Module no.	Description	No. of hours
	File transfer application	3
	CPU Scheduling algorithms	5
	Concurrency control and synchronisation	5
	Shell design	5
	Hands-on experiments with Linux and Android	5
	Cloud computing experiments	5

18. Brief description of module-wise activities pertaining to self-study component (mandatory for 700/800 level courses)

Module no.	Description	No. of hours

	Concurrency control and synchronisation	2
	Multi-core/Multi-Processor Operating Systems	5
	Real-time Operating Systems	5
	Energy Management in Operating Systems	5
	Distributed Operating Systems	5
	Linux and Android: case study	10
	Cloud computing: protocols, structures and experiments	10

19. Suggested texts and reference materials

STYLE: Author name and initials, Title, Edition, Publisher, Year

A. Silberschatz, P. B. Galvin, G. Gagne. Operating System Concepts, Eighth Edition. John Wiley & Sons, Inc., 2008
W. Stallings. Operating Systems: Internals and Design Principles, Sixth Edition, PHI, 2008.

20. Resources required for the course (*itemised & student access requirements, if any*)

20.1	Software	Linux OS/Pintos/Android
20.2	Hardware	
20.3	Teaching aids (videos, etc.)	
20.4	Laboratory	
20.5	Equipment	
20.6	Classroom Infrastructure	
20.7	Site visits	
20.8	Others (please specify)	

21. Design content of the course (Percent of student time with examples, if possible)

21.1	Design-type problems	
21.2	Open-ended problems	
21.3	Project-type activity	
21.4	Open-ended laboratory work	
21.5	Others (please specify)	

Date:

(Signature of the Head of the Department)

COURSE TEMPLATE

1.	Department/Centre proposing the course	Electrical Engineering

-----	---	----

13.	Course objectives (<i>about 50 words</i>): To provide a background of information retrieval methods from local repositories, digital libraries, as well as web-scale data-sources. While the prime focus of the course will be text data, it will also include an introduction to content based retrieval for media data.
------------	---

14.	Course contents (<i>about 100 words</i>) (<i>Include laboratory/design activities</i>): Motivation, evaluation, classical IR models, Indexing, ML techniques, Semantic search, MIR, Web-scale information retrieval, Query processing, User interfaces
------------	--

15. Lecture Outline (*with topics and number of lectures*)

Module no.	Topic	No. of hours
1	Introduction. Modes of information access - retrieval and navigation. Motivation for local / web-scale information retrieval. Contextual / personalized information retrieval. Relationship with question-answering, information summarization. Issues: Authenticity of information, Advertisements, Search Engine 'optimization', spelling variations	3
2	Evaluation of retrieval performance: Precision, Recall, Recall-precision graph, F-measure, Alternate measurements, Clickthrough data and relevance, Discounted Cumulative Gain, Utility vs. variety, Real time performance (latency)	4
3	Classical retrieval models: Boolean, Vector space, Binary Independence, Bayesian. Word root extraction	4
4	Speeding up information retrieval. Indexing and retrieval. Index structures. Memory based and disk based index. B-Tree, Trie, Hashing. Index construction and compression.	5
5	Case Study: Introduction to Lucene/Solr	1
6	Retrieving similar documents. Notion of similarity. Machine learning techniques. K-Means, Agglomerative, DB-Scan, Canopy, Approximate clustering. Flat and hierarchical clustering. k-NN, ANN, Classification techniques: SVM, Bayesian classifier	6
7	Towards semantics. PoS Tagging, Term weighting, N-grams, N-gram indexing. Latent semantic indexing. Relevance feedback. Performance and scalability issues	5
8	Multimedia information retrieval. Motivation. Content and context. Annotations. Content based retrieval. Introduction to media features (image, motion image, audio), feature indexing (kD-Tree, BoW ...), segmentation. multimodal information fusion.	5

9	Technologies for web-scale and distributed information retrieval. Crawling and indexing. Cross-language retrieval, Central and distributed indexing, Hadoop and map-reduce -- applications in retrieval, heterogeneous collections, P2P architecture (Napster), Agent based architecture. Link analysis (Page-rank algorithm). Hardware infrastructure for dynamic extensibility. Issues: Dynamic environment, query and update latency	5
10	Query languages, Query clustering (similar queries) and cacheing, User interfaces and visualization	4
COURSE TOTAL (14 times `L')		42

-----	--	----

13.	Course objectives (about 50 words): Intelligent systems are designed to sense, interpret, reason and act on the external environment using AI techniques. Artificial intelligence provide rigorous mathematical tools for solving complex real-world problems. In this course, students will learn the foundational principles that drive design of intelligent systems and its applications. They will have practice in implementing some of these systems. Learning objective of the course is to equip students with the tools to tackle new AI problems they might encounter in life.
-----	---

14.	Course contents (about 100 words) (Include laboratory/design activities): Introduction, Search, Markov Decision Process, Game Playing, Constraint Satisfaction, Bayesian Network, Logic, Planning, Searching with non-deterministic action
-----	---

15. Lecture Outline (with topics and number of lectures)

Module no.	Topic	No. of hours
1	Introduction	1
2	Search: Tree search, Dynamic programming, uniform cost search, A*, consistent heuristics, Relaxation	4
3	Markov Decision Process: Policy evaluation, policy improvement Policy iteration, value iteration Reinforcement learning: Monte Carlo, SARSA, Q-learning Exploration/exploitation, function approximation	6
4	Game Playing: Minimax, expectimax, Evaluation functions, Alpha-beta pruning, TD learning, Game theory	4
5	Constraint Satisfaction: Factor graphs, Backtracking search Dynamic ordering, arc consistency, Beam search, local search Conditional independence, variable elimination	4
6	Bayesian Network: Bayesian inference, Marginal independence Hidden Markov models, Forward-backward, Gibbs sampling, Particle filtering, Learning Bayesian networks, Laplace smoothing, Expectation Maximization	8
7	Logic: Syntax versus semantics, Propositional logic Horn clauses, First-order logic Resolution, Higher-order logics	9

	Markov logic; Semantic parsing	
8	Planning: the STRIPS language; forward planning; backward planning; planning heuristics; partial-order planning; planning using propositional logic; planning vs. scheduling.	3
9	Beyond classical search: searching with nondeterministic actions; searching with partial observations; online search agents; dealing with unknown environments.	3

13.	Course objectives (<i>about 50 words</i>): This course will be an attempt to look at how ideas and tools from electrical engineering can be applied to understand the workings of living organisms. We will be looking at both the <i>signals</i> that characterise biological information and dynamics, and the <i>systems</i> which integrate these and carry out the functionality of life.
------------	---

14.	Course contents (<i>about 100 words</i>) (<i>Include laboratory/design activities</i>): <i>Introduction to Cell Biology (DNA and Proteins); Introduction to Evolution; Modelling Evolution (Genetic Algorithms, Quasispecies); Genomic Signal Processing; Transcriptomic/Proteomic signals; Regulatory networks and dynamics; Protein interaction networks; Signal transduction and metabolic networks; Evolvability and Learning. Project activities on these topics (involving the use of online biological databases and bioinformatics software tools); Student presentations and Journal Club.</i>
------------	--

15. Lecture Outline (*with topics and number of lectures*)

Module no.	Topic	No. of hours
1	Introduction to Cell Biology: DNA and Proteins	3
2	Introduction to Evolution: How did all the complexity of life emerge in the first place?	3
3	Modelling Evolution: Genetic Algorithms, Quasispecies	3
4	Introduction to Signal Processing and Random Processes	3
5	Identification of gene coding regions	2
6	Identification of origin of replication	1
7	Periodicities of DNA sequences	1
8	How random/correlated is a DNA sequence?	1
9	DNA phylogeny	1
10	Transcriptomic/Proteomic signals: How do genes and proteins actually put genomic information into practice?	3
11	Regulatory networks and dynamics: Information flow between different biological components, Regulatory motifs, Mechanisms of control life	6

	employs to maintain stability and functionality, Reverse engineering from expression data	
12	Protein interaction networks: Structure of connections between life's building block, Role of modularity in biology	3
13	Signal transduction and metabolic networks	3
14	Evolvability and Learning	3
15	Student presentations and journal club	6

20. Resources required for the course (itemised & student access requirements, if any)

20.1	Software	MATLAB; some publicly available bioinformatics tools
20.2	Hardware	Standard PCs
20.3	Teaching aids (videos, etc.)	Some online videos (available on YouTube) will be used
20.4	Laboratory	Computing facilities
20.5	Equipment	N/A

20.6	Classroom Infrastructure	Multimedia projector
20.7	Site visits	N/A
20.8	Others (please specify)	N/A

21. Design content of the course (Percent of student time with examples, if possible)

21.1	Design-type problems	10%
21.2	Open-ended problems	20% (current research in bioinformatics & systems biology)
21.3	Project-type activity	50%
21.4	Open-ended laboratory work	N/A
21.5	Others (please specify)	N/A

Date:

(Signature of the Head of the Department)

COURSE TEMPLATE

1.	Department/Centre proposing the course	Electrical Engineering
2.	Course Title (<45 characters)	Computational Perception and Cognition
3.	L-T-P Structure	3-0-0
4.	Credits	3
5.	Course Number	ELL788
6.	Status (category for program)	Program Elective

7.	Pre-requisites (course no/title)	None
----	----------------------------------	------

8	Status vis-a-vis other courses (give course number/title)	
8.1	Overlap with any UG/PG course of the Dept./Centre	None
8.2	Overlap with any UG/PG course of other Dept./Centre	None
8.3	Supersedes any existing course	No

9.	Not allowed for (indicate program names)	
----	--	--

10.	Frequency of offering	☐ Every sem ☐ 1st sem ☐ 2nd sem ☒ Either sem
-----	-----------------------	---

11.	Faculty who will teach the course TG, SC, SA, HG
-----	---

12.	Will the course require any visiting faculty? (yes/no)	No
-----	--	----

13.	Course objectives (about 50 words): This course is an introduction to current methods used in computational perception. It also examines different facets of cognitive processing. The course also discusses how knowledge about human perception and cognitive processing may be used to guide design of engineering systems.
------------	--

14.	Course contents (about 100 words) (Include laboratory/design activities): Introduction: Philosophical & Psychological models, Cognitive models & Bayesian Inferencing framework; Visual Perception of 3D space & scene; Perceptual processes for Object recognition & memorization; Auditory Perception; Haptic Perception; Attentional mechanism in multimedia perception; Applications: Image & video quality assessment, compression; Audio quality assessment, compression & indexing; Haptic interfaces; Cognitive Architecture; Computational Consciousness, Cognitive Robotics & Other applications
------------	--

15. Lecture Outline *(with topics and number of lectures)*

Module no.	Topic	No. of hours
1	Introduction	1
2	Perception (uni- and multi-modal) Vision, Hearing, taste, touch, olfaction	5
3	Higher order perception like object and pattern recognition (Biological and computational perspective)	4
4	Visual Perception of 3D space & scene Perceptual processes for object recognition & memorization	4
5	Attentional mechanism in multimedia perception, modelling perception, cognition & behaviour in real-time applications.	4
6	Executive function like planning & monitoring of complex behaviour, learning, memory and knowledge representations	5
7	Mental Imagery, Computational Model of Consciousness	3
8	Applications: Image & video quality assessment, compression Cognitive models & Bayesian Inferencing	3
	Audio quality assessment compression & indexing Haptic interfaces	3

10	Haptic Interfaces	2
11	Cognitive Architecture, Cognitive Robotics	3
12	Real world Applications (In Technology development, Health care, Defence, Industries etc.)	5
COURSE TOTAL (14 times `L')		42

16. Brief description of tutorial activities:

Module no.	Description	No. of hours

17. Brief description of laboratory activities

Module no.	Description	No. of hours

18. Brief description of module-wise activities pertaining to self-study component (mandatory for 700/800 level courses)

Module no.	Description	No. of hours
1	Sensory Processing Pathway of Brain	15
2	Cognitive models of Perception-action cycle	15
3	Design of Assistive Appliances	15

19. Suggested texts and reference materials

STYLE: Author name and initials, Title, Edition, Publisher, Year

20. Resources required for the course (itemised & student access requirements, if any)

20.1	Software	MATLAB, Python, Psychtoolbox and other open source s/w
20.2	Hardware	PC
20.3	Teaching aids (videos, etc.)	Projector with internet connectivity, You Tube videos
20.4	Laboratory	Computer and hardware laboratory
20.5	Equipment	

20.6	Classroom Infrastructure	Multimedia Projector
20.7	Site visits	
20.8	Others (please specify)	

21. Design content of the course (Percent of student time with examples, if possible)

21.1	Design-type problems	20%
21.2	Open-ended problems	20%
21.3	Project-type activity	40% (term paper/project)
21.4	Open-ended laboratory work	20%
21.5	Others (please specify)	

Date:

(Signature of the Head of the Department)

COURSE TEMPLATE

1.	Department/Centre proposing the course	Electrical Engineering
2.	Course Title (<45 characters)	Computational Linguistics
3.	L-T-P Structure	3-0-0
4.	Credits	3
5.	Course Number	ELL891
6.	Status (category for program)	PE for EET

7.	Pre-requisites (course no/title)	MTL106, COL106
----	---	----------------

8	Status vis-a-vis other courses (give course number/title)	
8.1	Overlap with any UG/PG course of the Dept./Centre	
8.2	Overlap with any UG/PG course of other Dept./Centre	COL772
8.3	Supersedes any existing course	

9.	Not allowed for (indicate program names)	
----	---	--

10.	Frequency of offering	Either sem
-----	------------------------------	------------

11.	Faculty who will teach the course Sumeet Agarwal, Rajakrishnan P. R. (HSS), Samar Husain (HSS)	
-----	--	--

12.	Will the course require any visiting faculty? (yes/no)	No
-----	---	----

13.	Course objectives (<i>about 50 words</i>): This course will provide an introduction to the systematic and quantitative study of language, focusing in particular on the view of language production/comprehension as a computational process, and looking at computational model and techniques that can be used to gain understanding of how language works.
-----	--

14.	Course contents (<i>about 100 words</i>) (<i>Include laboratory/design activities</i>): Introduction to language and linguistics; Mathematical foundations: statistics and machine learning; Introduction to corpus-based computational linguistics; Lexical analysis; Syntactic analysis; Semantic analysis; Discourse analysis; Psycholinguistics, computational cognitive models of language processing and evolution; Assignments and practical exercises involving the application of these techniques to real-word corpora
-----	--

15. Lecture Outline (*with topics and number of lectures*)

Module no.	Topic	No. of hours
1	Introduction to language and linguistics	3
2	Mathematical foundations: statistics and machine learning	3
3	Introduction to corpus-based computational linguistics	2
4	Regular expressions and automata	3
5	Phonology and Morphology: n-grams, HMM-based models	5
6	Part-of-Speech taggers	3
7	Context-free grammars and probabilistic models	4
8	Advanced computational models of syntax, e.g., Combinatory Categorical Grammar (CCG) and Tree Adjoining Grammar (TAG) models	3
9	Natural language parsers	3
10	Hierarchical HMM parsers as cognitive or memory models	2
11	Processing and production models for South Asian languages	2
12	Meaning, word-sense disambiguation	4
13	Pragmatics: Discourse analysis	3
14	Modelling language evolution	2

COURSE TOTAL (14 times `L')	42
-----------------------------	----

16. Brief description of tutorial activities:

Module no.	Description	No. of hours
	N/A	

17. Brief description of laboratory activities

Module no.	Description	No. of hours
	N/A	

18. Brief description of module-wise activities pertaining to self-study component (mandatory for 700/800 level courses)

Module no.	Description	No. of hours
1	Familiarisation with some standard corpora like the Hindi-Urdu Treebank	4
2	Lexical analysis: Study of prescribed research papers and other texts; use of actual corpora	10
3	Syntactic analysis: Study of prescribed research papers and other texts; study of parsing algorithms/models and application on real-world data	18
4	Semantics, pragmatics, language evolution: Study of prescribed research papers and other texts; computational approaches for these topics	10

19. Suggested texts and reference materials

12.	Will the course require any visiting faculty? (yes/no)	No
-----	---	----

13.	Course objectives (about 50 words): This course is intended to expose students to modern large-scale data analysis systems. This course will prepare students to be able to build such systems as well as use them effectively to address analytics and data science challenges.
------------	--

14.	Course contents (about 100 words) (Include laboratory/design activities): Introduction; Hadoop, Map-Reduce, GFS/HDFS, Bigtable/HBASE ; Extension of Map-Reduce: iMap-reduce (iterative), incremental map-reduce. SQL and Data-parallel programming, DryadLINQ. Data-flow parallelism vs. message passing. Data locality. Memory hierarchies. Sequential versus random access to secondary storage. NoSQL systems. NewSQL systems. Finding similar items and LSH; Search Technology: link analysis and Page-rank algorithm; Large Scale Graph Processing; Mining Streaming Data and Realtime analytics: Window semantics and window joins. Sampling and approximating aggregates (no joins). Querying histograms. Maintaining histograms of streams. Use of Haar wavelets. Incremental and online query processing: online aggregation
------------	---

-----	---	----

13.	Course objectives <i>(about 50 words):</i> This course will provide an opportunity to the students for learning about cloud computing. Cloud has emerged as a leading paradigm for cost-effective, scalable, well-managed computing. Actual machines may be virtualized into machine-like services. The cloud computing infrastructure managing, sharing, scheduling, provisioning and geographic replication of resources and tasks provides a new architectural framework. Students, on completion of the course, will acquire the ability to design and use cloud environment. They will also achieve conceptual clarity about the technology of cloud platforms.
-----	--

14.	Course contents <i>(about 100 words) (Include laboratory/design activities):</i> Introduction; Example System: Apple iCloud, Amazon-AWS; Fundamental Concepts: Cloud Characteristics, Cloud delivery models; Cloud Enabling Technology: broad-band network, virtualisation technology; Cloud Infrastructure Mechanisms: Logical Network Perimeter, Virtual Server, Cloud Storage Devices; Cloud Architecture: Workload Distribution Architecture, Resource Pooling Architecture, Dynamic Scalability Architecture, Hypervisor Clustering Architecture, Load Balanced Virtual Server Instances Architecture, Elastic Resource Capacity Architecture, Elastic Disk Provisioning Architecture, Redundant Storage Architecture; Cloud Security: Encryption, Identity and Access management, Cloud-based Security Groups; Working with Cloud: Building Service Platforms, Cost Metrics, Pricing Models.
-----	--

COURSE TEMPLATE

1.	Department/Centre proposing the course	Electrical Engineering
2.	Course Title (<45 characters)	Natural Computing
3.	L-T-P Structure	3-0-0
4.	Credits	3
5.	Course Number	ELL799
6.	Status (category for program)	Program Elective for EET; DE for EE1 and EE3

7.	Pre-requisites (course no/title)	MTL106, COL106
----	---	----------------

8	Status vis-a-vis other courses (give course number/title)	
8.1	Overlap with any UG/PG course of the Dept./Centre	No
8.2	Overlap with any UG/PG course of other Dept./Centre	No
8.3	Supersedes any existing course	No

9.	Not allowed for (indicate program names)	
----	---	--

10.	Frequency of offering	☐ Every sem ☐ 1st sem ☐ 2nd sem ☒ Either sem
-----	------------------------------	---

11.	Faculty who will teach the course Prof. Santanu Chaudhury, Prof. Jayadeva, Dr. B. K. Panigrahi, Dr. Sumeet Agarwal
-----	--

12.	Will the course require any visiting faculty? (yes/no)	No
-----	---	----

13.	Course objectives (<i>about 50 words</i>): The field of Natural Computing deals with a large family of techniques inspired by nature, including biological, social and physical systems. This course will provide an introduction to a broad range of natural computing algorithms and illustrate how they can be applied to real-world problems. On completion of the course, student should be able to: - comprehend different paradigms of natural computing - solve problems using natural computing
------------	--

14.	Course contents (<i>about 100 words</i>) (<i>Include laboratory/design activities</i>): Introduction to natural computing uncertainty handling: probability and fuzzy logic; evolutionary computing and problem solving as search; swarm intelligence ant colonies, swarm robotics; immunocomputing; introduction to DNA computing; basics of quantum computing
------------	--

15. Lecture Outline (*with topics and number of lectures*)

Module no.	Topic	No. of hours
1	Introduction to Natural Computing	2
2	Probabilistic reasoning and belief networks	8
3	Fuzzy logic and fuzzy rule-based systems	4
4	Evolutionary computing: GA, GP, Differential evolution	8
5	Swarm intelligence: Ant colony and other algorithms	4
6	Swarm robotics	2
7	Immuno-computing	5
8	Introduction to DNA computing	3
9	Basics of Quantum computing	4
10	Example applications	2
COURSE TOTAL (14 times 'L')		42

16. Brief description of tutorial activities:

Module no.	Description	No. of hours

--	--	--

17. Brief description of laboratory activities

Module no.	Description	No. of hours

18. Brief description of module-wise activities pertaining to self-study component (mandatory for 700/800 level courses)

Module no.	Description	No. of hours
1	Natural computing: Techniques inspired by nature, versus computation in natural systems. What are the similarities and differences? Study of research papers and texts.	12
2	Evolution as an algorithm for optimisation/learning; modelling/formalising biological evolution.	10
3	Distributed intelligence/computation in nature: the 'wisdom of crowds' in social/biological systems.	10
4	Immunology: The immune system as a cognitive system, with learning and memory.	10

12.	Will the course require any visiting faculty? (yes/no)	No
-----	--	----

13.	Course objectives (<i>about 50 words</i>): Intelligent agents and multi-agent systems is a key enabling technology for distributed large-scale problem solving. The objective of this course is to provide a foundation for various scientific and technical aspects of multi-agent systems.
------------	--

14.	Course contents (<i>about 100 words</i>) (<i>Include laboratory/design activities</i>): The course will comprise lectures on the various topics on agent technology and self-study on its applications in various domains. The topics are elaborated below. The material of the lectures will be gathered from text-books and recent research papers. The self-study will comprise study and analysis of typically 5-8 substantial research papers and will result in a term paper that will be evaluated.
------------	--

15. Lecture Outline (*with topics and number of lectures*)

Module no.	Topic	No. of hours
1	Introduction: Introduction to course structure. What are software agents, agent-based systems. Motivation, Properties of agents and environments. Agents as a software engineering paradigm. Agents as an AI paradigm. Agents and human society.	2
2	Agent architecture (Abstract and concrete): Reactivity and proactivity. Purely reactive agent architecture. Reasoning. Agent with states. Goal-directed (proactive) agents. Intelligent behavior and autonomy. Logic based architecture. B-D-I Architecture	4
3	Agent Communication: Introduction to multi-agent system. Speech-act theory. Communication layers - Syntactic and semantic. ACL and CL (e.g. KQML and KIF). Role of world model - introduction to semantic web and ontology.	6
4	Cooperative Agent based systems: Benevolence and self-interest in agents. Planning. Review of search techniques. Planning as a search problem. Centralized planning and distributed planning. Interaction protocol.	6
5	Mobile agents: Distributed systems architectures - mobile agents. Benefits and concerns. Types of mobility - logical mobility, cloning, migration. Static and dynamic itineraries. Communication challenges and solutions for mobile agents. Security risks and mitigation.	3
6	Agent platforms and standardization: Agent life-cycle. Agent platforms and their characteristics (life-cycle support). Standardization (Introduction to FIPA architecture and ACL). Mobile agent platforms. Mobility across	3

	platforms.	
7	Agents with self-interest: Rational decision-making. Concept of payoff and social welfare. Cooperation with conflict of interest. Mechanisms, protocols and strategies. Individual rationality, Pareto-efficiency and Social welfare. Zero-sum encounters. Nash equilibrium. Voting and auctions. Bargaining - Time-constrained negotiations. Reasoning with uncertainty.	6
8	Learning in agent-based systems: Motivation. Centralized learning and Interactive learning. Supervised, reinforcement and unsupervised learning.	6
9	Swarm Intelligence / Evolutionary computation	6
COURSE TOTAL (14 times 'L')		42

-----	--	----

13.	Course objectives (about 50 words): Cyber-physical systems (CPSs) combine cyber capabilities (computation and/or communication) with physical capabilities (motion or other physical processes). Cars, aircraft, and robots are prime examples, because they move physically in space in a way that is determined by discrete computerized control algorithms. Designing these algorithms to control CPSs is challenging due to their tight coupling with physical behavior. This course will focus on designing Cyber-physical systems.
-----	--

14.	Course contents (about 100 words) (Include laboratory/design activities): Introduction: core principles behind CPSs; Specification of CPS, CPS models: Continuous, Discrete, Hybrid, Compositional; Abstraction and System Architecture, Design by Invariants, Sensing and Fusion, Cloud of Robots/CPS; Case Studies: Healthcare, Smart Grid, Transportation
-----	--

-----	---	----

13.	Course objectives (about 50 words): To introduce the student to fundamental notions in statistical machine learning, and familiarise him/her with the most widely used algorithms for both supervised and unsupervised learning. Also, to provide the student with some hands-on experience of using machine learning techniques to model real-world data
-----	---

14.	Course contents (about 100 words) (Include laboratory/design activities): Introduction to Machine intelligence and learning; linear learning models; Artificial Neural Networks: Single Layer Networks, LTUs, Capacity of a Single Layer LTU, Nonlinear Dichotomies, Multilayer Networks, Growth networks, Backpropagation and some variants; Support Vector Machines: Origin, Formulation of the L1 norm SVM, Solution methods (SMO, etc.), L2 norm SVM, Regression, Variants of the SVM; Complexity: Origin, Notion of the VC dimension, Derivation for an LTU, PAC learning, bounds, VC dimension for SVMs, Learning low complexity machines - Structural Risk Minimisation; Unsupervised learning: PCA, KPCA; Clustering: Origin, Exposition with some selected methods; Feature Selection: Origin, Filter and Wrapper methods, State of the art - FCBF, ReliefF, etc; Semi-supervised learning: introduction; Assignments/Short project on these topics
------------	--

15. Lecture Outline (with topics and number of lectures)

Module no.	Topic	No. of hours
1	Introduction; Probabilistic and Statistical Foundations	4
2	Linear models for regression and classification	4
3	Artificial Neural Networks	6
4	Support Vector Machines	6
5	Learning Theory; Complexity	3
6	Unsupervised Learning: Dimensionality reduction	4
7	Clustering	5
8	Probabilistic Graphical Models	4
9	Feature Selection	3
10	Semi-supervised Learning: Introduction	3
COURSE TOTAL (14 times 'L')		42

16. Brief description of tutorial activities:

Module no.	Description	No. of hours
	N/A	

17. Brief description of laboratory activities

Module no.	Description	No. of hours
	N/A	

18. Brief description of module-wise activities pertaining to self-study component (mandatory for 700/800 level courses)

Module no.	Description	No. of hours
2.	Linear Models: Experimentation with different techniques discussed in class	6
3.	Neural Networks and SVMs: Applications on real-world data	12
4.	Learning theory: Reading of research papers and supplementary materials	4
5.	Unsupervised learning: Applications on real-world data	10
6.	Graphical models, feature selection, and semi-supervised learning: Reading of prescribed research papers and lecture notes; experimentation with different techniques discussed in class	10

-----	---

12.	Will the course require any visiting faculty? (yes/no)	No
-----	---	----

13.	Course objectives (<i>about 50 words</i>): The focus of using computers today is primarily getting drawn towards multimedia data: audio, images, graphics and video. This is a multi-disciplinary field, encompassing the domains of Computer Graphics, Signal, Image and Video Processing, Computer Vision, Computer Architecture and Embedded Systems, Operating Systems, Pattern Recognition and Machine Learning, Psychology, Data and Signal Compression and Coding, Computer and Communication Networks, and Information Management and Retrieval.
------------	---

14.	Course contents (<i>about 100 words</i>) (<i>Include laboratory/design activities</i>): Multimedia signal processing; coding and compression; standards: logic, issues, future directions; Multimedia issues governing developments in computer architecture and embedded systems, computer and communication networks, operating systems; Search and retrieval.
------------	---

15. Lecture Outline (*with topics and number of lectures*)

Module no.	Topic	No. of hours
1	Types of Multimedia Data (audio, music, graphics, animation, image, video, haptics and more); Signal Processing Fundamentals	1
2	Data representation	2
3	Images, Colour, Video	3
4	Digital Audio and Music	2
5	Graphics and Animation	3
6	Haptics	1
7	Basic Multimedia Coding and Compression: Lossless and lossy	4
8	Image Compression and Standards: JPEG	5
9	Video Compression and Standards: MPEG-1, 2, 4, 7 and H.264 and HEVC(H.265)	10
10	Audio Compression and Standards: MPEG	3
11	Computer Architecture and Embedded Systems for Multimedia Systems	1
12	Networks and Protocols for Multimedia Communication	1
13	Internet Multimedia Content Distribution	1
14	Multimedia over Wireless and Mobile Networks	1
15	Social Media Sharing; Cloud Computing	1
16	Search and Retrieval of Multimedia Data	3

COURSE TOTAL (14 times `L')		42

-----	---

12.	Will the course require any visiting faculty? (yes/no)	No
-----	--	----

13.	Course objectives (about 50 words): Vision is all about examining images, and drawing semantic interpretation from it. The course will examine developments in the field over the years, right from estimating depth, to other high level tasks such as detecting faces. Developments in this field have been across some rather interdisciplinary and diverse areas, such as psychology, projective geometry, signal processing, and pattern recognition and machine learning.
-----	--

14.	Course contents (about 100 words) (Include laboratory/design activities): Link between Computer Vision, Computer Graphics, Image Processing and related fields; feature extraction; camera models; multi-view geometry; applications of Computer Vision in day-to-day life.
-----	--

15. Lecture Outline (with topics and number of lectures)

Module no.	Topic	No. of hours
1	Relation between Computer Vision, Computer Graphics, Image Processing	1
2	Image Analysis: Feature Detection, Active Contours, Segmentation	5
3	Photometry and Geometry; Invariants	3
4	Multiple View Geometry: 2-D and 3-D	6
5	Camera Models; Calibration	3
6	Alignment; Structure from Motion; Dense Motion Estimation	5
7	Visual Tracking	4
8	Computational Photography	6
9	Recognition	8
10	Miscellaneous Applications	1
COURSE TOTAL (14 times 'L')		42

10.	Frequency of offering	☐ Every sem ☐ 1st sem ☐ 2nd sem ☒ Either sem
-----	------------------------------	---

11.	Faculty who will teach the course Subrat Kar, Swades De, Brejesh Lall, Santanu Chaudhury
-----	--

12.	Will the course require any visiting faculty? (yes/no)	NO
-----	---	----

13.	Course objectives (about 50 words): Pervasive Computing, also known as Ubiquitous Computing, is the consequence of having computing devices smaller in size, more powerful and connected. One can envision that almost any device, clothing, tools, appliances, cars, homes, human body, even coffee mug, can be embedded with chips to connect the device to an intelligent network of other devices. The course surveys the emerging hardware and software landscape of this subject. After doing the course, students are expected to understand the challenges for low-resourced communication and computing and the schemes to overcome these including intelligent reasoning. Students will get a feel for the complexity that cyber-physical systems bring.
------------	--

14.	Course contents (about 100 words) (Include laboratory/design activities): Introduction, computer and network architectures for pervasive computing, mobile computing mechanisms, human-computer interaction using speech and vision, pervasive software systems, location mechanisms, practical techniques for security and user-authentication, and experimental pervasive computing systems.
------------	---

15. Lecture Outline *(with topics and number of lectures)*

Module no.	Topic	No. of hours
1	Pervasive Computing: Vision and Challenges	2
2	Embedded Architectures	4
3	Pervasive Networks	6
4	Pervasive Naming and Context-Awareness	6
5	Pervasive Data access	5
6	Programming Environments for Pervasive Computing	5
7	Security in Pervasive Systems	6
8	Human Interaction in Pervasive Systems	8

COURSE TOTAL (14 times `L')		42

21.4	Open-ended laboratory work	
21.5	Others (please specify)	

Date:

(Signature of the Head of the Department)

COURSE TEMPLATE

1.	Department/Centre proposing the course	Electrical Engineering
2.	Course Title (<45 characters)	Network Performance Modeling and Analysis
3.	L-T-P Structure	3-0-0
4.	Credits	3
5.	Course Number	ELL894
6.	Status (category for program)	Program Elective

7.	Pre-requisites (course no/title)	Probability Theory and Stochastic Processes (MAL 250, or ELL711, or equivalent). Having prior knowledge of network systems is not necessary.
----	----------------------------------	--

8	Status vis-a-vis other courses (give course number/title)	
8.1	Overlap with any UG/PG course of the Dept./Centre	ELL473 (Computer Communication) – 15% overlap
8.2	Overlap with any UG/PG course of other Dept./Centre	MAL740 (Queueing Networks for Computer Communication Systems) – 30% overlap SIL769 – 10% overlap
8.3	Supersedes any existing course	None

9.	Not allowed for (indicate program names)	--
----	--	----

10.	Frequency of offering	☐ Every sem ☒ 1st sem ☐ 2nd sem ☐ Either sem
-----	------------------------------	---

11.	Faculty who will teach the course Swades De (EE) Jun Bae Seo (EE)
-----	--

12.	Will the course require any visiting faculty? (yes/no)	No
-----	---	----

13.	Course objectives (<i>about 50 words</i>): The course will cover the advanced mathematical concepts related to computer communication systems. Specific focus will be on performance modeling and analysis of queueing systems and networks. In view of connecting the concepts of queueing theory and stochastic optimization theory, it will also briefly touch upon the concepts of dynamic programming. Some programming exercises on network traffic generation with various distributions, traffic classification, and priority queueing exercises are planned within the lecture course curriculum. The course would be useful to the Masters/Dual-Degree and PhD students interested in doing project/research in the areas of computer communication networks and industrial systems performance modeling and analysis.
-----	---

14.	Course contents (<i>about 100 words</i>) (<i>Include laboratory/design activities</i>): 1) Network performance models and classifications 2) Hidden Markov Models (HMM) 3) Delay and throughput analysis using Markov models 4) Performance analysis with multi-class traffic 5) Renewal theory and regenerative processes 6) Performance analysis with semi-Markov traffic characteristics 7) Network performance analysis with interactive servers 8) Practical network traffic characterization 9) Network performance stability 10) Introduction to dynamic programming 11) Example network modeling scenarios in various engineering applications
-----	--

15. Lecture Outline (*with topics and number of lectures*)

Module no.	Topic	No. of hours
------------	-------	--------------

1	Network performance models and classifications	3
2	Hidden Markov Models (HMM) and network applications	3
3	Delay and throughput analysis using Markov models	5
4	Performance analysis with multi-class and priority traffic	4
5	Performance with Erlangian traffic, batch arrival and service processes	4
6	Renewal theory and regenerative processes	4
7	Performance analysis with semi-Markov traffic characteristics	5
8	Network performance analysis with interactive nodes/links	4
9	Network performance stability	2
10	Practical network traffic characterization	2
11	Introduction to dynamic programming	4
12	Example computer communication scenarios	2
COURSE TOTAL (14 times 'L')		42
